FAIRBURN READY MIX, INC.

To Whom It May Concern:

In December 2006, we began testing the Kleenoil Bypass Oil Filtration System on some of our ready mixed concrete trucks; specifically: F5600i International trucks powered with Cummins ISM engines. At the time, we were doing oil drains approximately 4 times per year. After 6 months, which would have been 2 normal oil drains, we had not

changed the oil or the regular oil filters. We only changed out the Kleenoil cartridges and took oil samples for independent analysis. We were so impressed with the results; we decided to test the Kleenoil filters on our Komatsu WA 320 wheel loader on both the engine and hydraulics.

Late in 2007, after running the same oil for a year, we changed our oil and filters in the ready mixed concrete trucks. The oil sample analysis showed the old oil that we replaced was actually cleaner than the new oil we put in. The analysis also showed the oil's additive package was still in excellent condition.

Now, in May 2008, we have been running the Kleenoil filters on the Komatsu loader for a year as well and the results have been just as impressive as they were on the ready mix trucks. Not only have the filters saved us the cost of the oil, filters and labor to change them, but the components are running on cleaner than new oil all the time. This cannot help but have a positive effect on our maintenance costs in the coming years.

After going to an annual oil drain rather than 4 times per year, we are saving 75% on the cost of our oil and filters while giving our components the cleanest oil possible. We have made a corporate decision to install Kleenoil filters on all future equipment. We have no reservations in recommending The Kleenoil Filter System to other equipment owners.

Sincerely,

Merrell Moore
